Email Hosting Facility

Network provides the connections and the intelligence to route traffic between CH and customers proxy servers. Load balances customer requests between service hosts. Provide Internet presence (i.e. answers for mail cp.net) and network security. Service Hosts provide the CPU processing power for client requests (Webmail, POP, SMTP, IMAP, LDAP, Calendar). Provide security with UNIX encrypted password access to directories. Storage Servers make data stored on EMCs available to service hosts. Multiple Sun Enterprise 4500s running the Veritas File System (VxFS). Industry leading Fault tolerance. Multiple CPUs, GBs of RAM, and redundant power. Multiple redundant interfaces. Provisioning System - create/update mailboxes, user preferences, and business rules. Database called CPDB. Interface to the DB in MAC or App.
